THIS YEAR, GROW A GARDEN!

Spring is officially just days away, and we are counting down the days! *NoCo Bloom* is back for another year of gardening guidance, and this issue is dedicated to new gardeners. Those of you with the glimmer of hope in your eye; seed starters and new home owners; those of you who are inspired to bring your yard, patio, or veggie patch to life this year. Maybe you just moved to the area, or potentially into your first house with a yard...or maybe you've been here a long time, and just got bit by the gardening bug?

We've picked a few topics to get you through all the ups and downs as a new gardener. How do I start? When do I transplant? What about hiring a landscape designer? What tools do I need? When is the right time to begin? These topics and more are covered in the next few pages along with an extensive community calendar that offers many gardening education opportunities to learn even more.

Remember, the best step towards success in the garden is always the first one. Happy Gardening! §

WHEN TO START VEGETABLE TRANSPLANTS

Jon Weiss, CSU Master Gardener in Larimer County

Do those seed catalogs in your mailbox have you dreaming

about what to grow in your vegetable garden? An important consideration when deciding whether to directly seed or use transplants is the maturity of the particular variety. Due to the short growing season in Colorado, many summer favorites (tomatoes, peppers) must be planted via a "start" or transplant.

Seed packets usually state maturity in terms of "days to harvest" (DTH). For many vegetables, you will need to start them by seed indoors before you plant them outside—if you want to have a harvest in July or August. In the case of tomatoes, peppers, and other vegetables planted via transplants, the clock starts when a transplant is put into the garden, not when seeded. Consider in your planting schedule that transplants also need a 7-10 day "hardening off period" before planting outside.

Another tip to bypass all of this, visit The Garden's Spring Plant Sale (May 11-12) where hundreds of vegetable varieties are ready and available for sale, many of which are heirloom. §

WHAT "MITE" HAPPEN TO YOUR LAWN

Tony Koski, Turf Specialist CSU Department of Horticulture & Landscape Architecture

As I write this in January, we in the northern Front Range are experiencing one the driest winters in many years. It has been sunny, windy, warmer than normal (I've never played so much golf in January!), with intermittent extreme cold. The only thing missing? Any reasonable

amount of precipitation. Of course, this all could be changed by a few snowstorms or a wet spring—making what I'm writing now meaningless in March.

If we continue with the dryness, what COULD happen to your lawn? The most severe problem that we see after a dry winter is turf injury by grass mites. These tiny, insect-like

critters (more closely related to spiders) essentially suck the life out of your grass as it begins greening up in March. Their activity is favored by warm, dry springs that follow dry winters. They can double their populations in a lawn weekly, which can result in rapid damage—and lawn death. Most commonly seen on south- and west-facing lawns, sections of the lawn just stop greening up—while other parts of your lawn green up normally.

The good news is that mites hate moisture—so their activity and damage can be prevented by watering once or twice a month from December to March for an hour or so with hose and sprinkler. A few winter waterings of the lawn can almost guarantee the demise of the mites. No pesticides are needed with this approach!

The bad news is that—by the time you read this—it will be too late to do the winter watering and your lawn may have suffered mite injury. If this is the case, hire someone to HEAVILY aerate the affected areas and overseed with the appropriate seed species. For more rapid results, cut out the dead areas and plant the appropriate sod species. §

FIVE TOOLS

EVERY GARDENER NEEDS

Dillon Hancock, Operations and Horticulture Manager, Gardens on Spring Creek

Getting started in the garden without the right tools can

be an exercise in frustration. Do yourself a favor and stock your tool belt with these five essentials every gardener needs.

1) PRUNERS (SNIPS)

A sharp pair of pruners can do everything from cutting small branches to deadheading more delicate annuals and perennials. Snips are a great choice for mostly vegetative plant care and small woody perennials.

2) HORI HORI (SOIL KNIFE)

A good strong soil knife or Hori Hori tool is the perfect multi-use tool for a gardener. Use it for weeding, planting, cutting rootbound plants and even cleaning out the cracks in your walkways.

3) SPADE

If you plan on planting larger perennials, trees or shrubs then you'll need a good spade to do the job. They're also great for breaking up hard soils and moving materials like rock and mulch around the garden.

4) LEAF RAKE

Rakes are necessary for keeping the garden neat and tidy during the growing season and essential for Fall cleanup.

5) DEBRIS HOLDER

Whether you use a collapsibletype bin, or a plastic garbage can, you'll want something to hold all the debris from your garden to haul away or compost. §

SACKYARD CRASH COURSE

Michelle Provaznik, Director, Gardens on Spring Creek

You've moved into a new home or are ready for a landscape re-do, and it hits you—where do I start? The task may feel insurmountable, as if you have no idea where to start. Ten years ago, my family faced this very question when we moved into a home on a half-acre lot. Our crash course of experience and sweat equity can teach you the simple steps to mindfully tackle this very rewarding, yet daunting endeavor.

GET ACQUAINTED

I spent the first growing season getting to know my yard—what was planted and where, how the irrigation system worked, sunny and shady areas, and drainage.

All of these can potentially change, but they inform decisions going forward.

WHAT DO I WANT?

Maybe you need a play area for kids, you want to grow cutting flowers and herbs, or simply a peaceful place to enjoy nature. Understanding what you want from your yard is critical. For us, priorities included less lawn, large vegetable garden, place for fruit trees, outdoor kitchen, places to sit and gather around the entire site, and lots of color.

DRAW THE DREAM

Even though I have some training in landscaping, I still couldn't figure out how to put ideas together to form a cohesive design. Fresh perspective was needed, so I hired a landscape designer to create a hardscape plan. Her design brought verything together in a way that made sense, provided continuity and flow. It has been our guide ever since. Highly consider hiring a landscape designer—it can save you a lot of money and backaches in the long run.

TIME TO GET DIRTY

Evaluate your plan to determine next steps—chunk priorities out in manageable tasks. Maybe you want to hire a contractor or maybe you can't wait to get your hands dirty—or a combo of both. Our plan was ambitious. We've been implementing stages of it for the past eight years. We did much of the work ourselves—removed over 2,000 sq. ft. of sod, moved tons of soil, built a rock garden, constructed a flagstone patio, planted countless plants and modified the drip irrigation. We hired professionals to build the pergola, expand the concrete patio, and modify the irrigation system.

REAP THE REWARDS

Don't forget to do this step! This is the first year in a long while that we won't be landscaping. Of course, you will find us out in the garden weeding, planting, deadheading, and harvesting. Or maybe just sitting on the patio enjoying a job well-done. \$\mathscr{G}\$

UNDERSTANDING LIGHTFOR GROWING INDOORS

Joshua Craver, PhD, Associate Professor of Controlled Environment Horticulture, CSU Department of Horticulture and Landscape Architecture

When growing plants indoors, providing the proper lighting can be tricky. Below is a brief explanation of the two key properties of light

you should keep in mind when considering electric lamps for indoor growing.

The first property is light intensity ("how much" light we are supplying to the plant). This is commonly measured in quantum units (μ mol·m⁻²·s⁻¹). Watch out for lamps that report light intensity in footcandles or lux, as these measurements pertain to how humans perceive light and are not appropriate for plants.

Photosynthetically Active Radiation (PAR)

The second property is the color (or wavelength) of light. While many lamps will list specific colors of light (e.g., blue and red) emitted, the most important detail to look for is whether the wavelengths listed fall within the range of 400–700 nm. This range is referred to as photosynthetically active radiation (PAR), which is a technical term for the specific wavelengths of light that plants use for photosynthesis and growth.

EXPLORE NEW CORNERS

OF THE GARDENS ON APRIL 1

Beginning April 1, five new acres of the Gardens on Spring Creek will open with limited hours. New gardens include the theme gardens, the Great Lawn, Undaunted Garden, Prairie & Foothills Gardens, and the Wetlands. In addition, the Rock Garden reopens just in time for hundreds of spring bulbs to burst open.

The Visitor's Center and original surrounding gardens remain closed due to ongoing construction. Admission is free, but no restrooms or running water are accessible for visitors, so please plan your trip accordingly. Check our website for open touring hours at fcgov.com/gardens. \$\mathbb{g}\$

From April 26 to May 5, cities all from all over the world will compete to see who can document the most animals and plants! City Nature Challenge is an international bioblitz. All you need is a curious mind and to download the app to your smartphone. Residents are encouraged to get out in their garden, natural area, and open space and take photos of species and identify them.

This year is Fort Collins' first year to accept the challenge. Join the Gardens on Spring Creek, Fort Collins Natural Areas, Audubon Rockies, Larimer County and Bird Conservancy of the Rockies to beat Boulder! Learn more and see the map of sample areas at fcgov.com/nature-challenge.

WEEKEND WATER-SAVING PROJECTS

SATURDAY
APRIL
20

Katie Collins, Water Conservation Coordinator, Fort Collins Utilities

Q: I'M LOOKING FOR QUICK AND EASY WATER-SAVING LANDSCAPE PROJECTS. ANY IDEAS?

A: Swapping a patch of underutilized grass with a perennial bed is a great

way to reduce water use while adding interest to your yard. With simple planning, it can be quick and inexpensive!

TAKE 30 MINUTES TO MAP YOUR SPRINKLER SYSTEM.

Make a sketch of your property. Turn on every sprinkler zone and draw the location of each zone and each sprinkler head. Water-wise tip: wait until May 1 to turn on your system.

TAKE 5 TO 30 MINUTES TO IDENTIFY STAND-ALONE ZONES.

Sprinklers cover area best when the water sprayed from each sprinkler head reaches the next closest head(s). When a sprinkler zone stands alone, meaning heads from other zones aren't helping to water the area, the zone can be removed without compromising remaining sprinkler coverage. An example of this is the strip of grass next to the driveway.

TAKE 15 MINUTES TO DESIGN THE SPACE (OR NOT!).

Take the guesswork out of design and purchase a Garden In A Box at ResourceCentral.org/gardens.

WANT TO LEARN MORE? **Check out the Weekend Water Savings class** on April 20. Learn landscape tips and get to know equipment that can take a chunk out of outdoor water use. The class costs \$10. Register at *fcgov.com/gardens*.

TAKE AN AFTERNOON TO RETROFIT THE ZONE.

When you change the landscape, you must change the way you water. After removing the grass, cap all but one sprinkler head on the zone. Replace the last head with a drip retrofit kit, available at a hardware store. Plug a dripline into the drip head. Set aside about four hours (depending on area) plus a trip to the store.

TAKE 2 HOURS TO PLANT AND MULCH!

Water regularly in the first several weeks, then start dialing back. Train those plants to be water-wise! §

TOP 5 QUESTIONS TO ASK YOUR LANDSCAPE DESIGNER

Deryn Davidson, Horticulture Agent, CSU Extension in Boulder County

Looking to rehab your landscape this summer or starting your garden from scratch? Using a landscape designer can be a useful way to help you create your vision. As you interview potential designers, consider these tips:

1) STYLE CHECK

Check out your designer's portfolio and make sure their style matches your vision.

2) SPECIALITY CHECK

Inquire if your professional specializes in a certain type of design.

3) CONCEPT VERSUS DETAILS

Find out what services they offer. Sometimes people are misled because they think they'll get a design with specific details, when they only are given a concept. Some designers may not provide the specific design unless the client uses their services to install.

4) ASK ABOUT COSTS

Clearly state your budget. Ask if there are discounts available if they do the installation (common with designbuild businesses).

5) WHAT'S YOUR LEVEL OF INVOLVEMENT

How much do you want to be part of the process? Make sure your input and level of involvement are agreeable to the designer.
